

# THE SUPERNATURAL CLOUD FEBRUARY 28TH, 1963

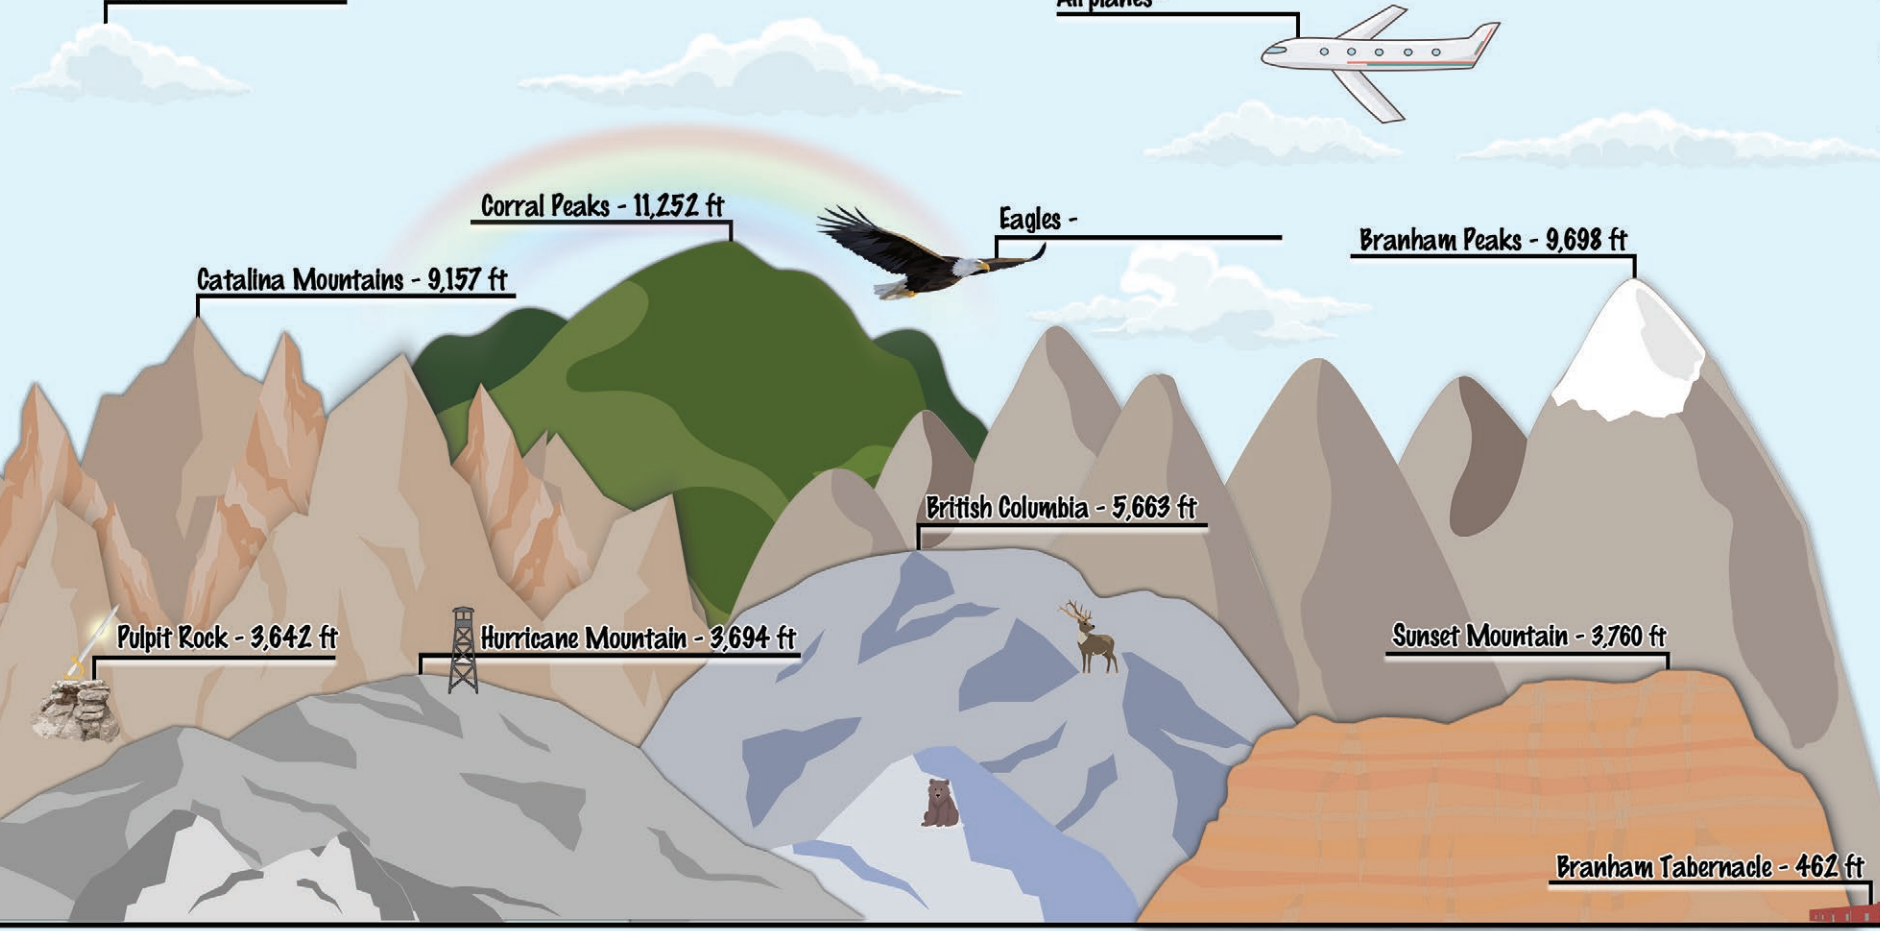

This page is an elevation/altitude comparison chart. When measuring on these types of charts, where the line starts on the object is the highest point.

Find the altitudes for the eagle, the clouds, and the airplane.

Write your answers on the lines below.

Clouds - \_\_\_\_\_

Airplanes - \_\_\_\_\_

Corral Peaks - 11,252 ft

Eagles - \_\_\_\_\_

Branham Peaks - 9,698 ft

Catalina Mountains - 9,157 ft

British Columbia - 5,663 ft

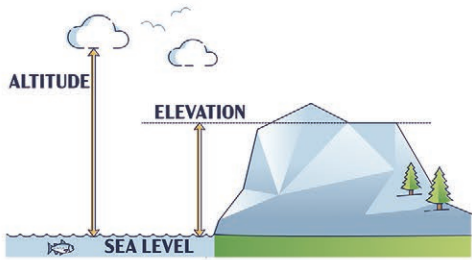

Sunset Mountain - 3,760 ft

Pulpit Rock - 3,642 ft

Hurricane Mountain - 3,694 ft

Branham Tabernacle - 462 ft

Sea Level

circle the answer:

**How did the scientists measure the Supernatural Cloud?**

- sea level
- altitude
- elevation

**Altitude** is the height of an object above earth or above sea level. Objects that fly or are suspended in the atmosphere are usually measured by altitude, which is commonly referred to in measurements of feet (12 inches).

**Elevation** is the height to which a certain place rises above sea level, which includes objects such as mountains, landmarks, and the tops of buildings and other structures. Elevation is also typically measured in feet (12 inches).

**Both** use an altimeter that measures the distance of a point above sea level.

**Elevation Map**

\*the places located on page 1 are in the highlighted states

**How much distance between?**

The Cloud **26.0 miles**  
 — clouds **8.5 miles**

**FUN FACT!**

According to scientists, the Cloud was 26 miles high and 30 miles across.

If you add up all of the elevations/altitudes of the mountains, clouds, airplanes, eagles, and the Branham Tabernacle,

**Is it higher than the Cloud altitude?**

**YES or NO**

Altitude will pull the feathers out. And the eagle's the only one's got feathers to stand when he gets up there. His feathers are growed in, fastened down, nailed down. Amen. He can go so high till the buzzard, or crow, or chicken hawk, would die trying to follow him.
